

A Weighted-Tree Similarity Algorithm for Multi-Agent Systems in e-Business Environments

Virendra C.Bhavsar*

Harold Boley**

Lu Yang*

*Faculty of Computer Science, Univ. of New Brunswick, Fredericton

**Institute for Information Technology – e-Business, NRC, Fredericton

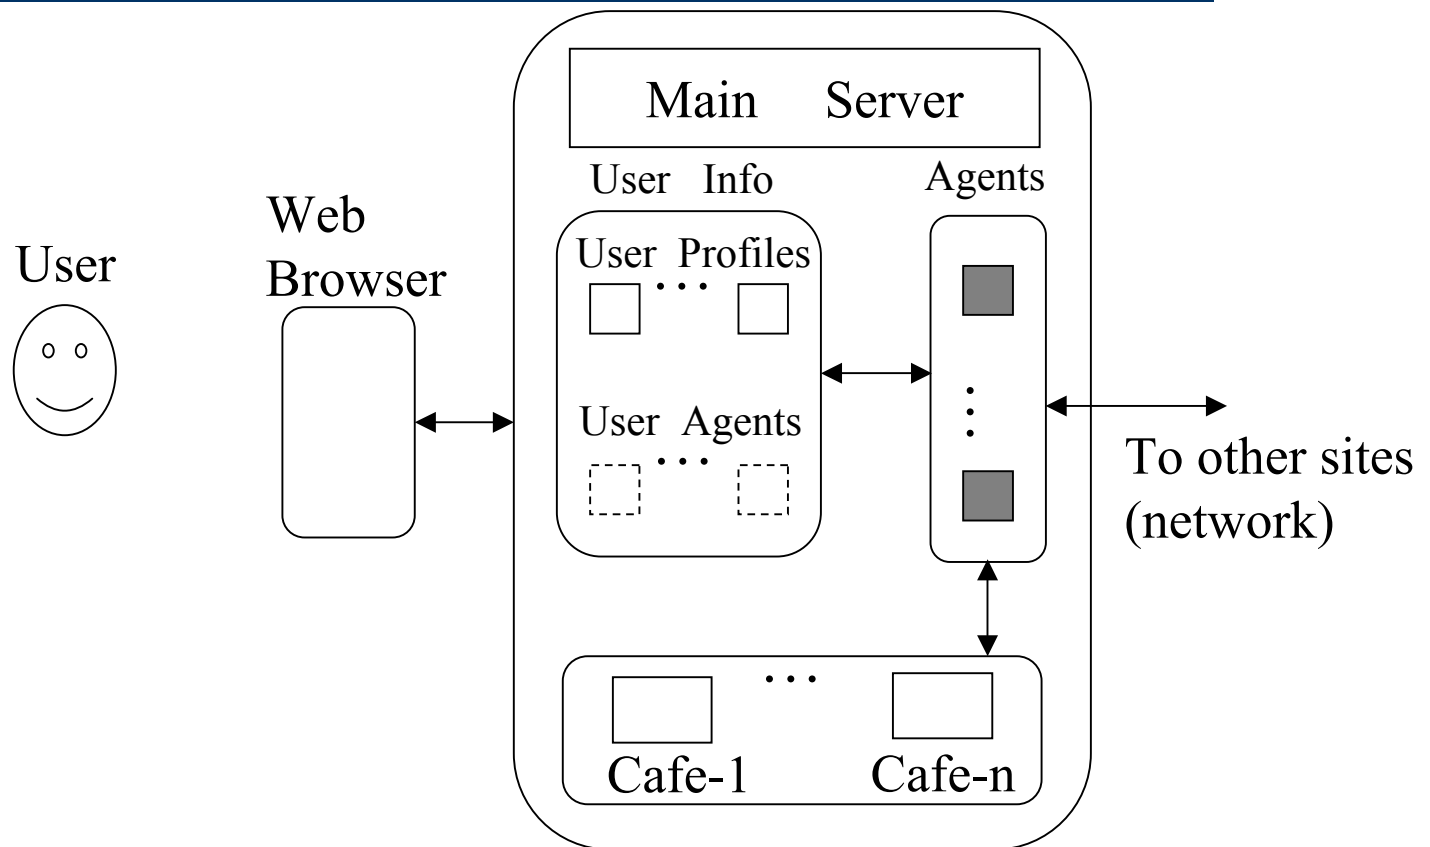

Outline

- Introduction
- Multi-agent system architecture
- Tree representation
- Similarity of trees
- Experimental results
- Conclusion

Introduction

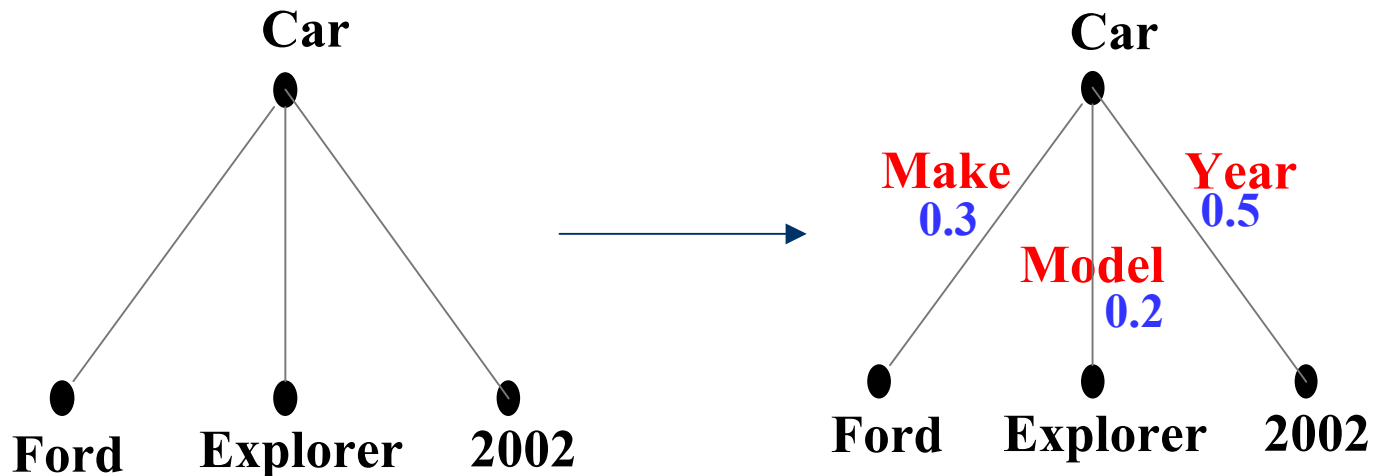

- e-business, e-learning.
- Semantic Web and Web Services.
 - Virtual marketplace.
 - Buyer-seller message exchange.
- Semantic match-making in multiagent systems.
 - Keywords/keyphrases.

Multi-agent system architecture

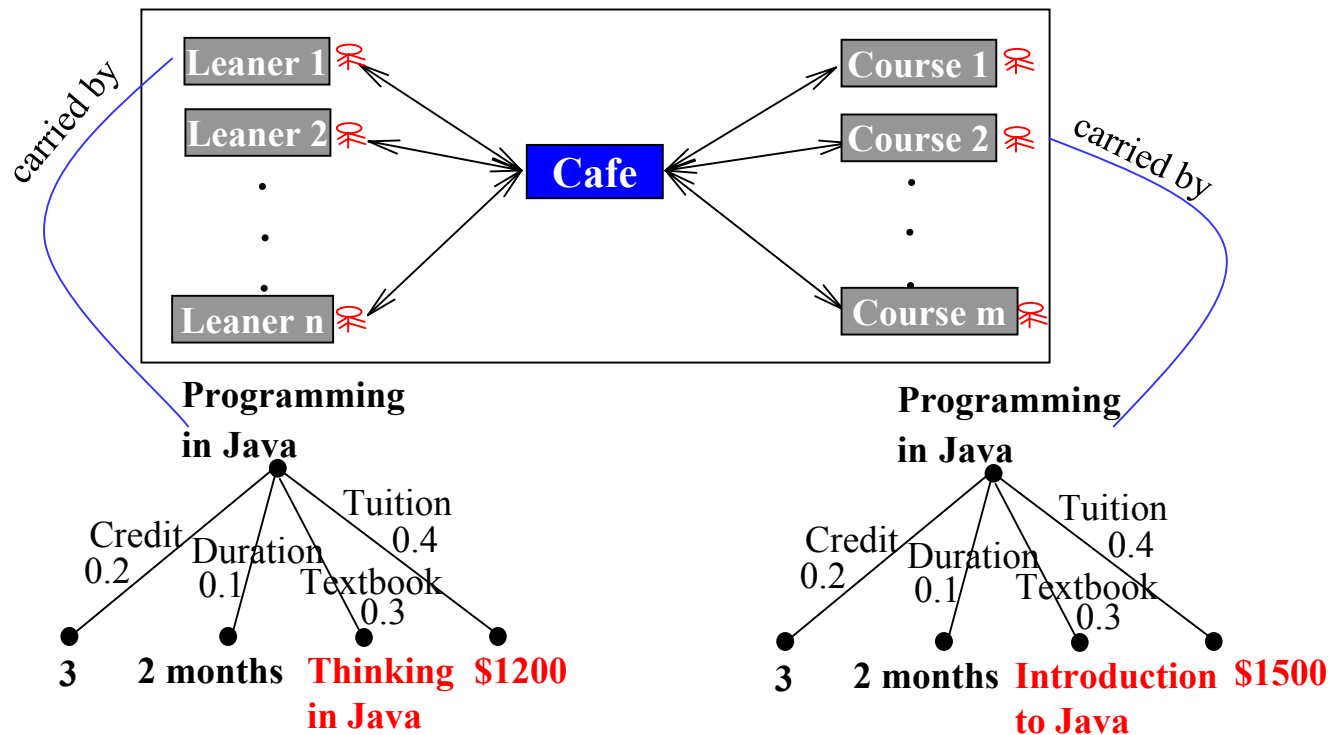

Tree representation

- Why tree representation?
 - Flexibly represent complex structures.
 - Why *arc-labelled*, *arc-weighted* tree?

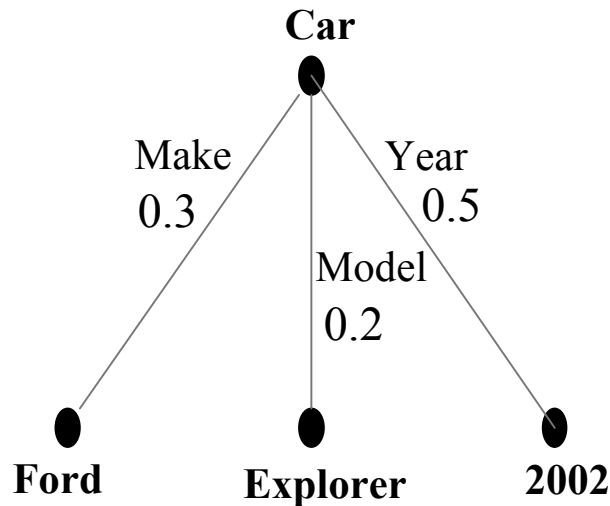

Matchmaking of agents

- Match-making in the Cafe.

Tree representation - lexicographic order

- The arcs are labelled in lexicographic (alphabetical) order.

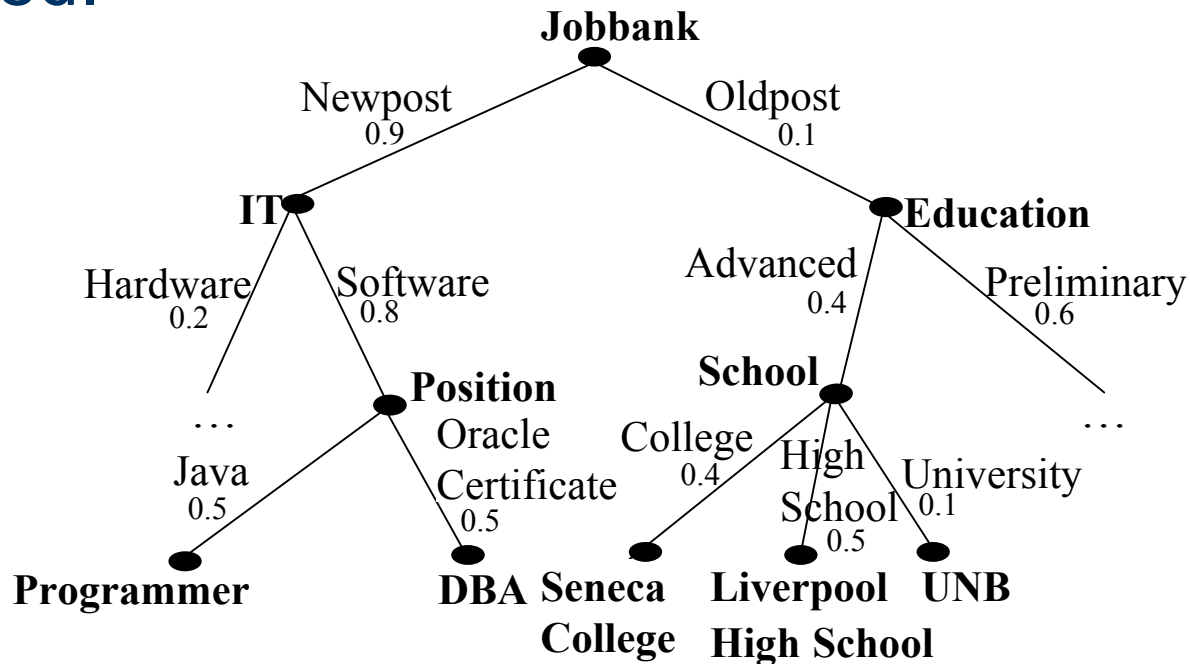

A tree describing “Car”.

A tree describing “Hotel”.

Tree representation - depth and breadth

- The depth and breadth of any subtree are not limited.

A tree that describes “Jobbank”.

Serialization of trees

- Weighted Object-Oriented RuleML.
- XML attributes for arc labels and weights.

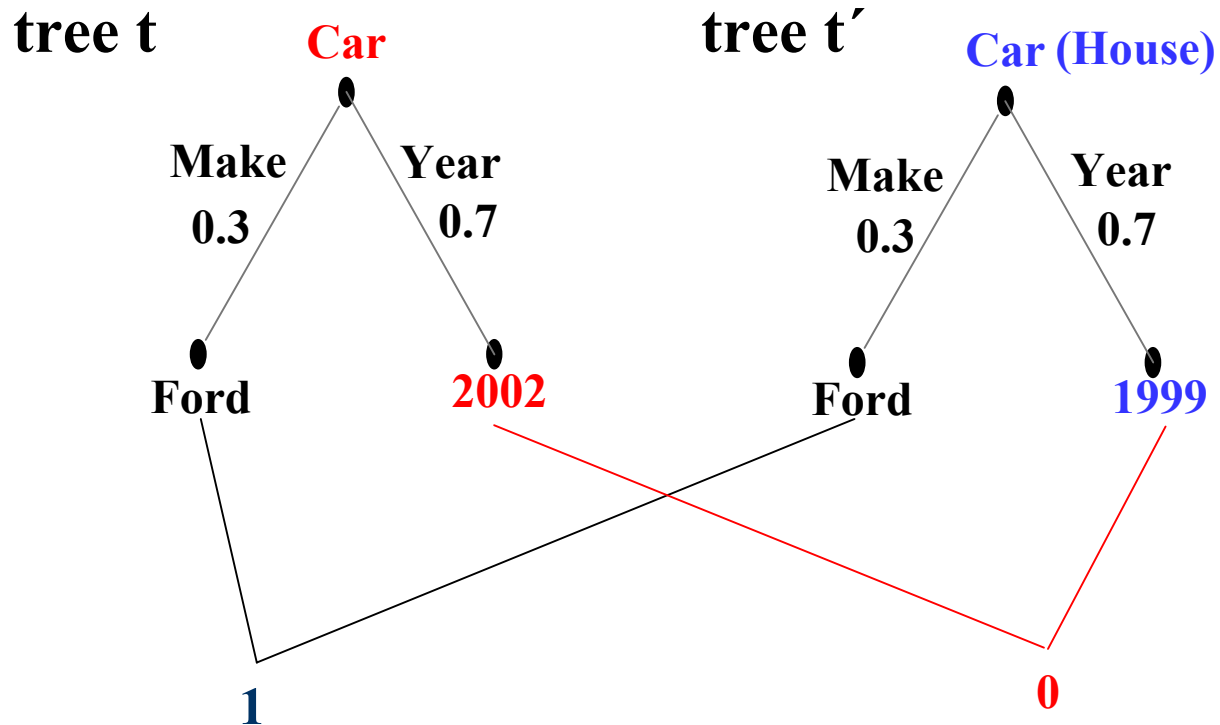

```
<cterm>  
  <_opc><ctor>Car</ctor></_opc>  
  <_r n="Make" w="0.3"><ind>Ford</ind></_r>  
  <_r n="Model" w="0.2"><ind>Explorer</ind></_r>  
  <_r n="Year" w="0.5"><ind>1999</ind></_r>  
</cterm>
```

Tree serialization in OO RuleML.

```
cterm[ -opc[ctor[car]],  
       -r[n[make],w[0.3]][ind[ford]],  
       -r[n[model],w[0.2]][ind[explorer]],  
       -r[n[year],w[0.5]][ind[1999]]  
      ]
```

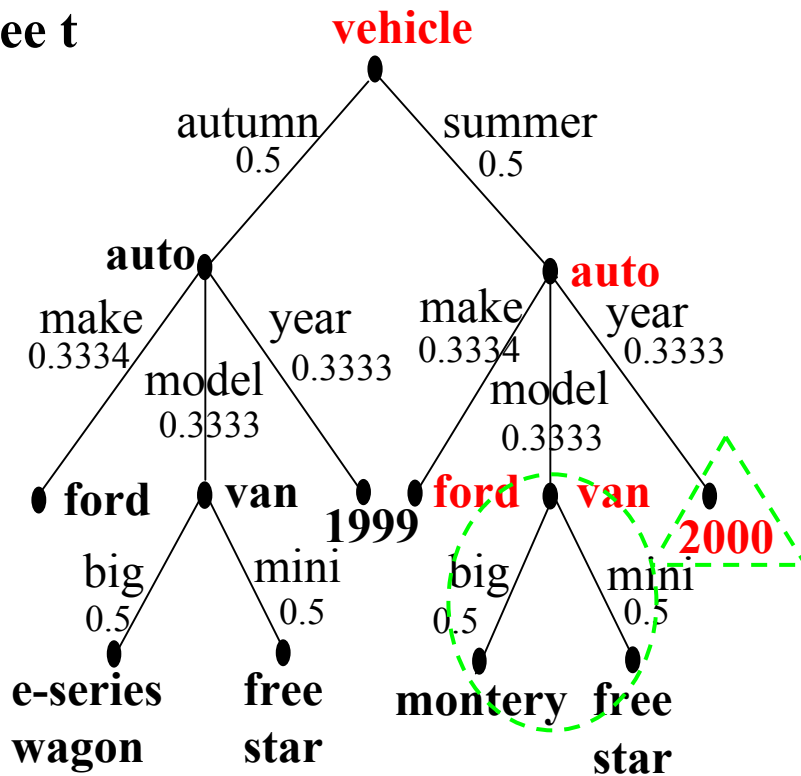

Tree representation in Relfun.

Similarity of trees – simple trees

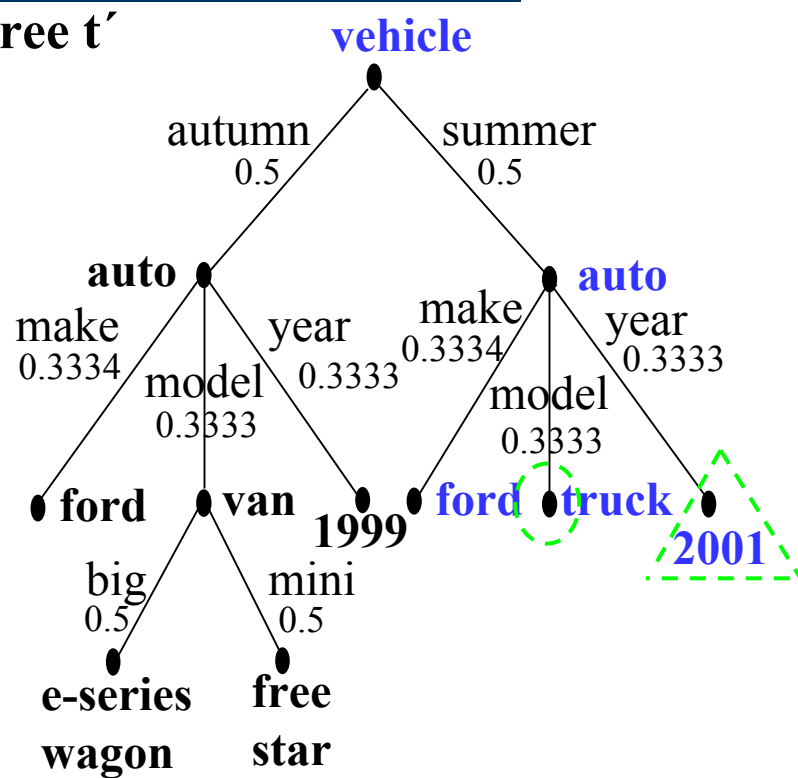

Similarity of trees – complex trees

tree t

tree t'

$$\sum s_i(w_i + w'_i)/2$$

→

$$\sum A(s_i)(w_i + w'_i)/2$$

$$A(s_i) = s_i$$

$$A(s_i) = \sqrt{s_i}$$

Algorithm for tree similarity

- Three main recursive functions of the algorithm.
 - **Treesim**(t, t'): Recursively compares any (unordered) pair of trees.
 - **Treemap**(l, l'): Co-recursively maps two lists, l and l' , of labelled and weighted arcs: descends into identical-labelled subtrees.
 - **Treeplicity**(i, t): Decreases the similarity with decreasing simplicity.

Experimental results –simple trees

Experiments	Tree	Tree	Results
1	<pre> graph TD auto((auto)) -- make 0.5 --> ford((ford)) auto -- year 0.5 --> 2002((2002)) ford --- t1((t1)) </pre>	<pre> graph TD auto((auto)) -- make 0.5 --> chrysler((chrysler)) auto -- year 0.5 --> 1998((1998)) chrysler --- t2((t2)) </pre>	0.1
2	<pre> graph TD auto((auto)) -- make 0.0 --> ford((ford)) auto -- year 1.0 --> 2002((2002)) ford --- t1((t1)) </pre>	<pre> graph TD auto((auto)) -- make 1.0 --> ford((ford)) auto -- year 0.0 --> 1998((1998)) ford --- t2((t2)) </pre>	0.5
	<pre> graph TD auto((auto)) -- make 0.0 --> ford((ford)) auto -- year 1.0 --> 2002((2002)) ford --- t3((t3)) </pre>	<pre> graph TD auto((auto)) -- make 1.0 --> ford((ford)) auto -- year 0.0 --> 2002((2002)) ford --- t4((t4)) </pre>	1.0

Experimental results – simple trees (cont'd)

Experiments	Tree	Tree	Results
3	<p>auto</p> <p>mustang</p> <p>t_1</p>	<p>auto</p> <p>ford explorer 2000</p> <p>t_2</p>	0.2823
	<p>auto</p> <p>mustang</p> <p>t_3</p>	<p>auto</p> <p>ford explorer 2000</p> <p>t_4</p>	0.1203

Experimental results – identical tree structures

Experiments	Tree	Tree	Results
4	<p style="text-align: center;">t_1</p>	<p style="text-align: center;">t_2</p>	0.55
	<p style="text-align: center;">t_3</p>	<p style="text-align: center;">t_4</p>	0.7000

Experimental results – progressively complex trees

Experiments	Tree	Tree	Results
5	auto • t_1	t_2 <pre> graph TD auto((auto)) -- make 1.0 --> ford((ford)) </pre>	0.3025
		t_3 <pre> graph TD auto((auto)) -- make 0.5 --> ford((ford)) auto -- model 0.5 --> explorer((explorer)) </pre>	0.3025
		t_4 <pre> graph TD auto((auto)) -- make 0.3 --> ford((ford)) auto -- model 0.2 --> explorer((explorer)) auto -- year 0.5 --> 2002((2002)) </pre>	0.3025

Experimental results – complex trees

Experiments	Tree	Tree	S_i $\sqrt{S_i}$
6	<p style="text-align: center;">tree t_1</p>	<p style="text-align: center;">tree t_2</p>	<p style="text-align: center;">0.5950</p> <p style="text-align: center;">0.7611</p>

Experimental results – complex trees (cont'd)

Experiments	Tree	Tree	S_i	
			S_i	$\sqrt{S_i}$
7	<p>tree t_1</p>	<p>tree t_2</p>	0.5894	0.6816

Conclusion

- Tree representations – useful for e-Business, e-Learning.
- Matchmaking in multiagent systems – a versatile tree similarity algorithm is proposed.
- Executable specification available in functional-logic language: Relfun.
 - A Java implementation is in progress.
- Future work - Clustering of agents.

Thank you!
